

# volatile modules

Use `dofile` with file name to process file.

Using `require` makes module names independent from extension, but it creates reference in `package.loaded['module_name']` table. Reference is created after loading module, so reference can be destroyed only later, by call

```
package.loaded['module_name'] = nil
```

One method is to provide module constructor

```
local M = {}  
function M.init()  
    package.loaded['module_name'] = nil  
    ...  
end  
  
return M
```
