

WiFi

AP settings

- minimum RSSI - works by sending a de-authentication packet to the STA, similar to the reconnect button found in the Controller UI. It is up to the STA to find a better AP to connect to. It may connect back to the same AP, especially if it is the only one within range. In its current form, it will not prevent an STA from reconnecting to the same AP (even multiple times).
- Interference Blocker (former Strict Mode) - AP will ignore signals weaker than a set value. It sorts clients that decide to connect to a weak AP instead of a stronger one. Can create dead spots so use with care.
