

# Load Average

## Issue

Common issue is that `la` inside LXC shows host's load average.

Related info:

- Bug 1870 - test and potentially enable lxcfs loadavg feature
- Separate loadavg for individual containers

## Solution

As solution, LXC provide option: `-l`, `--enable-loadavg` Enable loadavg virtualization.

This feature doesn't add to the isolation at all. `'sysinfo()'` will return the host information even when in a container.

`/etc/systemd/system/lxcfs.service.d/override.conf`

```
[Service]
ExecStart=
ExecStart=/usr/bin/lxcfs -l /var/lib/lxcfs
```

NOTE: After restarting `lxcfs.service`, running containers lost `/proc` access. Restart of containers is required.

```
systemctl restart lxcfs
```
